[Disabling settings protection](#)

You can protect *Host* settings with a password to prevent them from unauthorized modification by the remote user. With the Host settings protection enabled, whenever you try to access the settings, the program will prompt you for a password. To unlock the settings, you will need to enter the correct password and click **OK**:

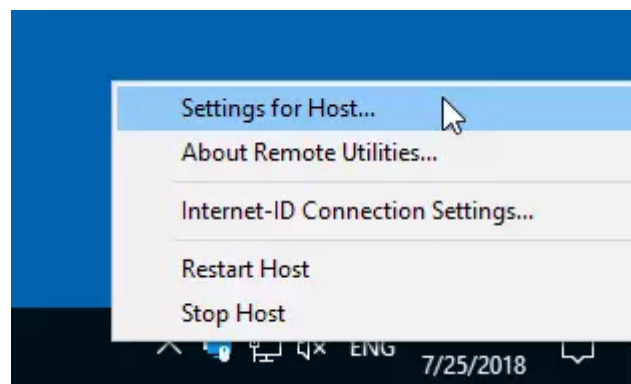

Important!

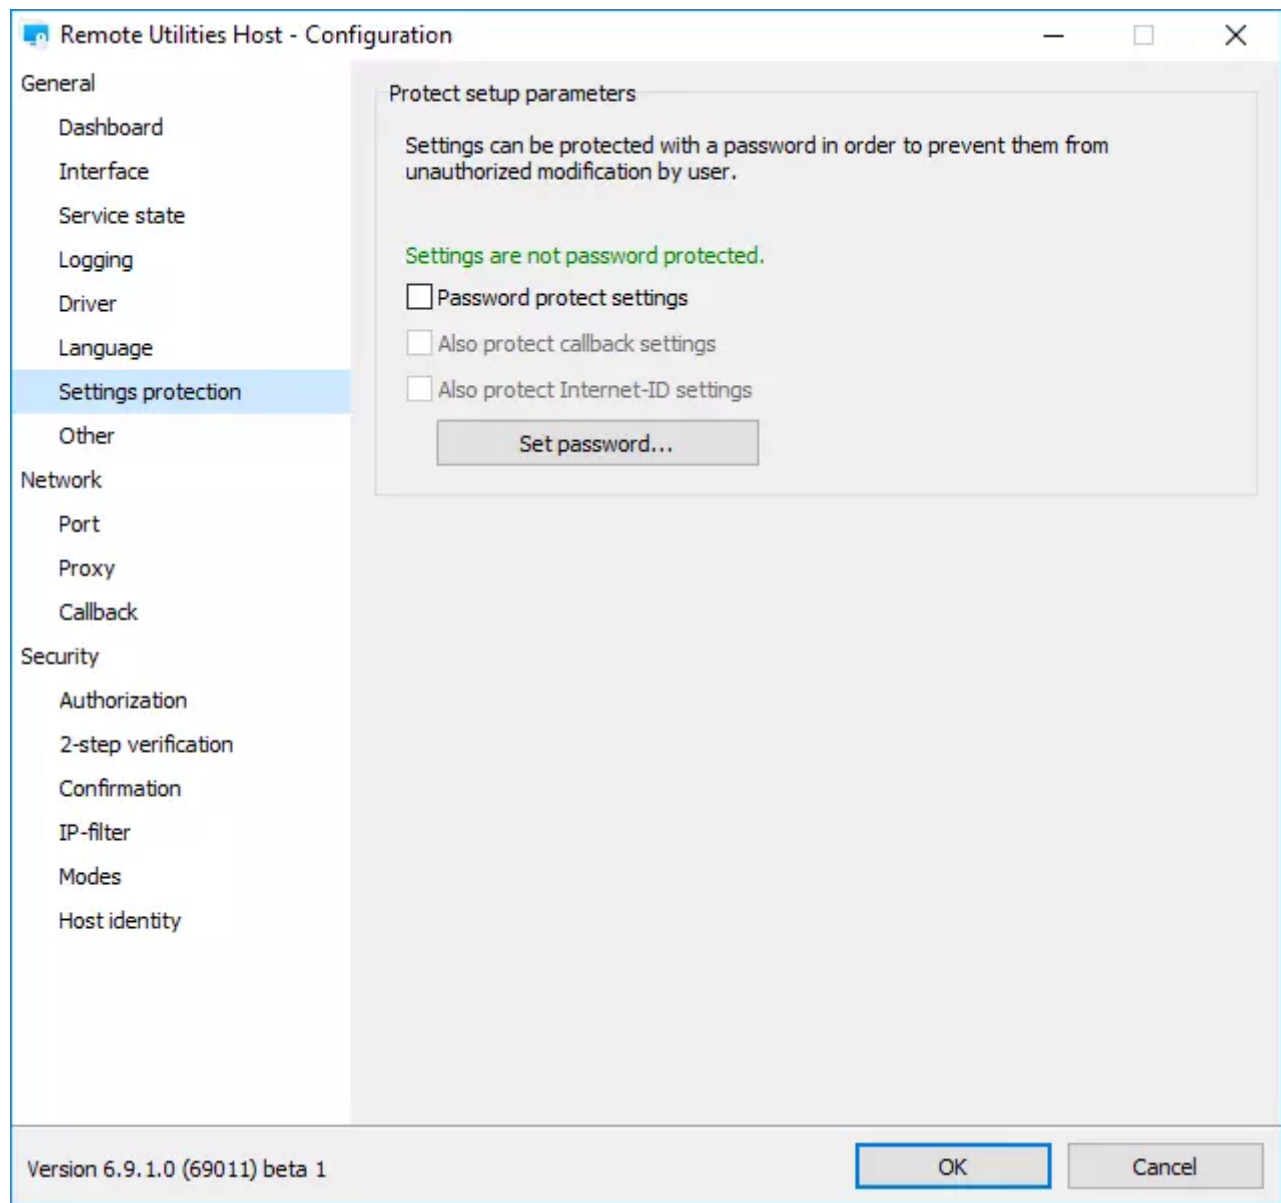

Do not confuse the settings protection password with the *single password security password*.

Enabling settings protection

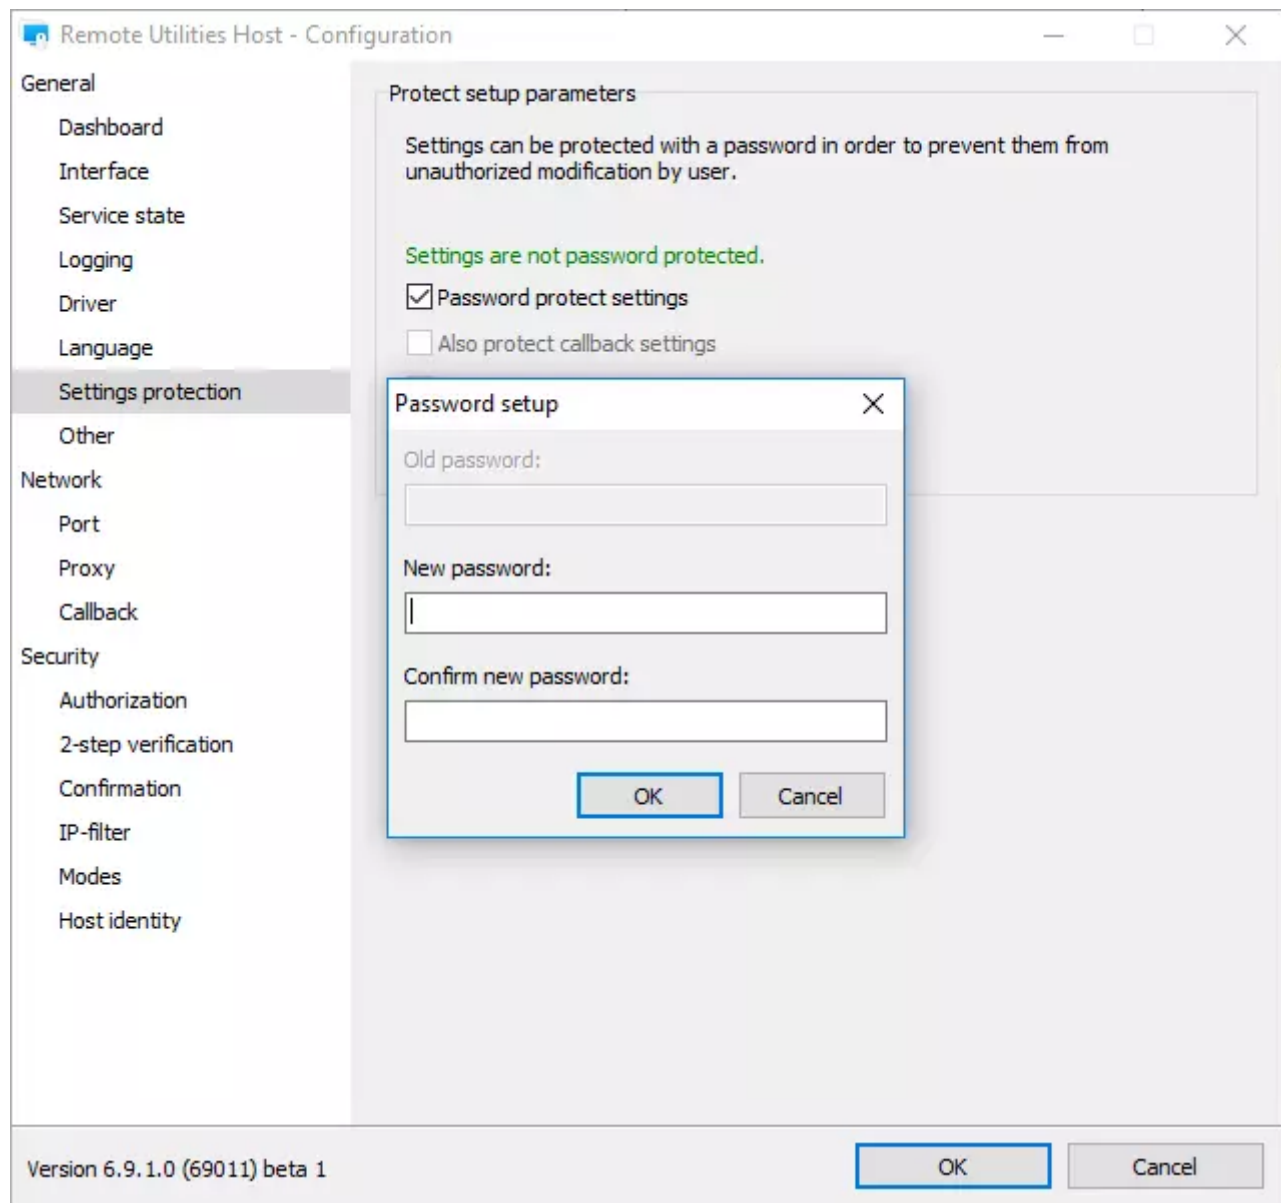

1. Right-click the **Host** icon in the system tray and select **Settings for Host**:

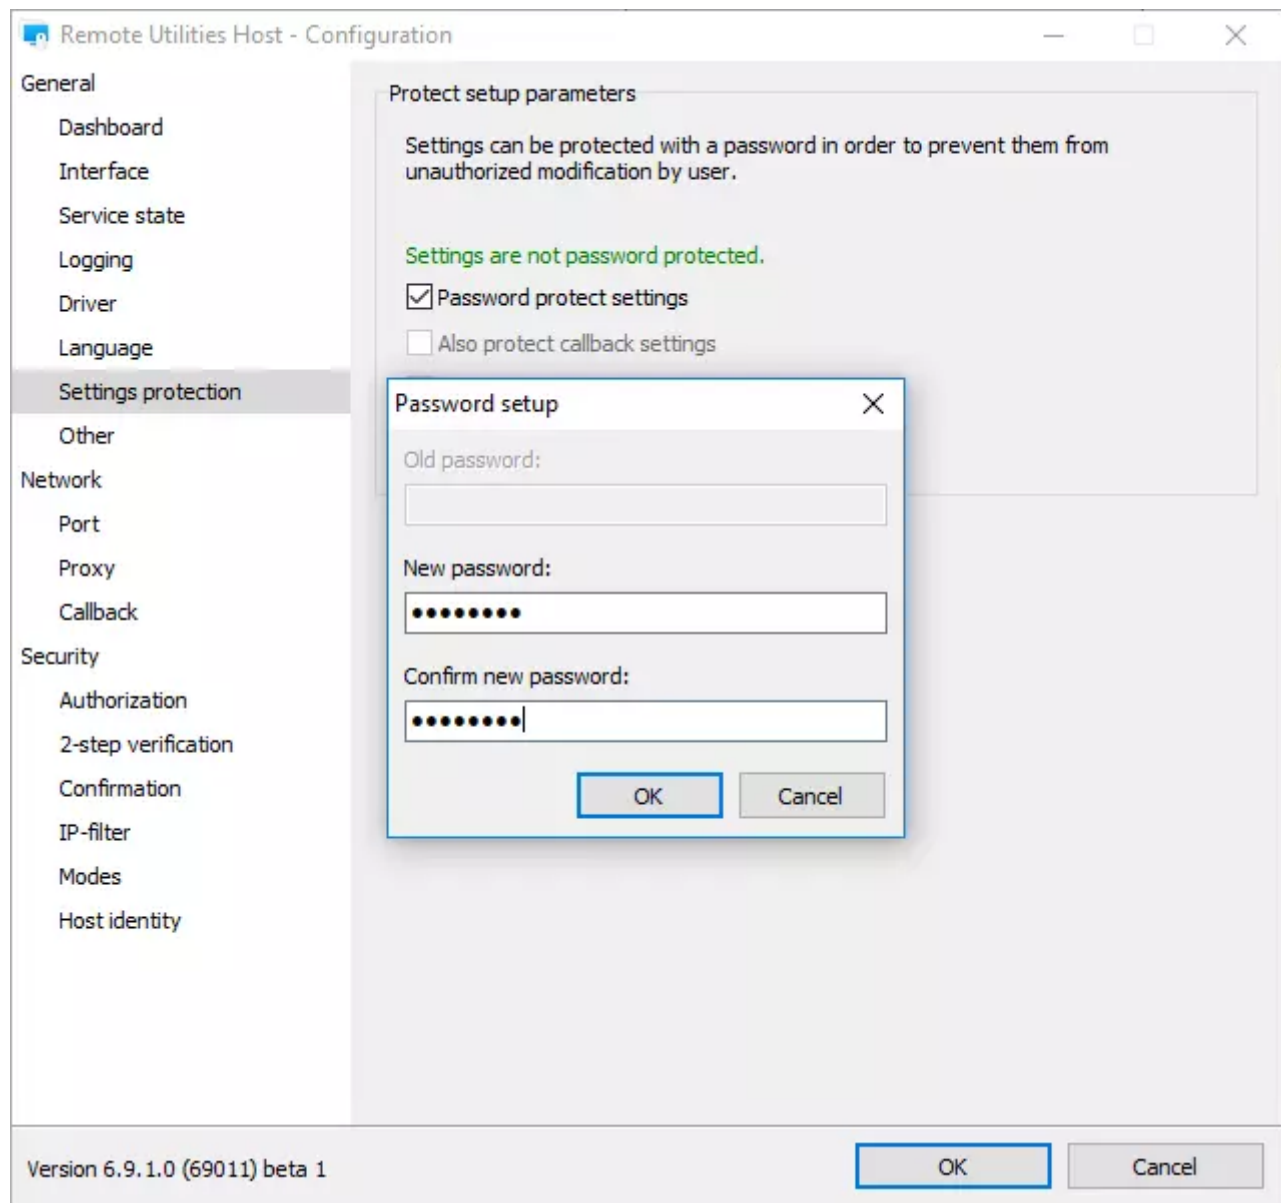

2. Select the **Settings protection** tab on the left:

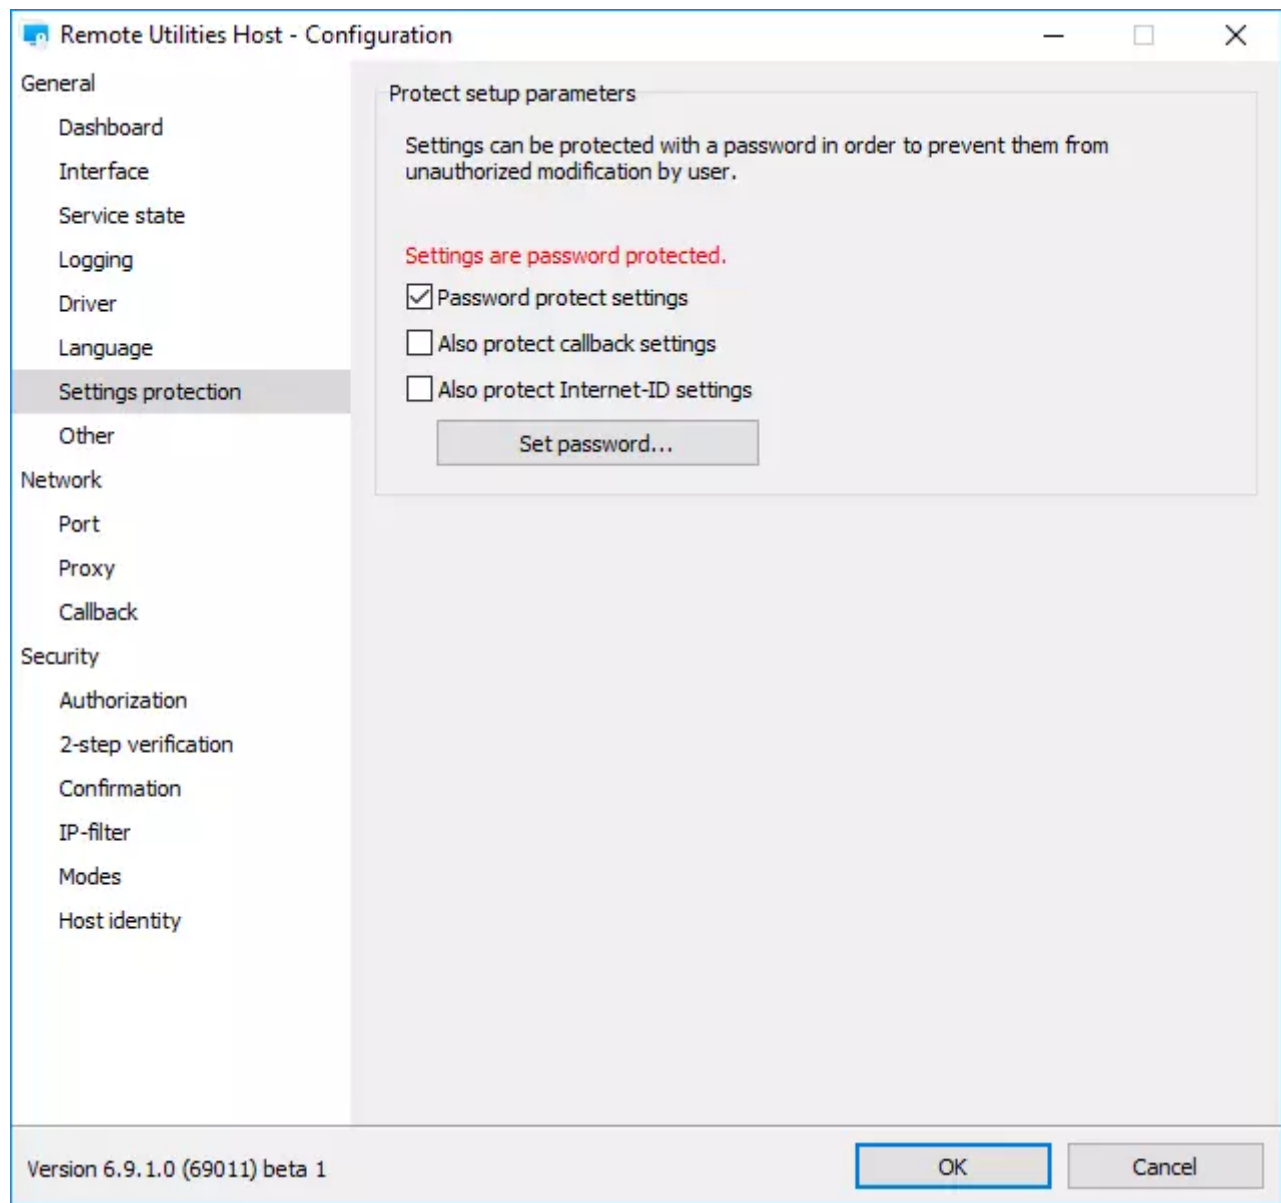

3. Enable the **Password protect settings** checkbox:

4. Enter and confirm a new password, then click **OK**.

5. [Optional] You can protect Internet ID settings and callback settings by selecting the respective check boxes:

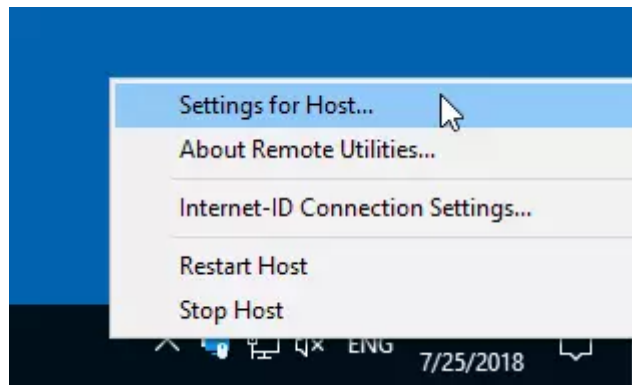

6. Click **OK** to close the settings window.

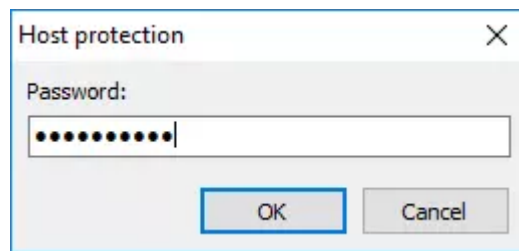

Changing settings protection password

In order to change the settings protection password:

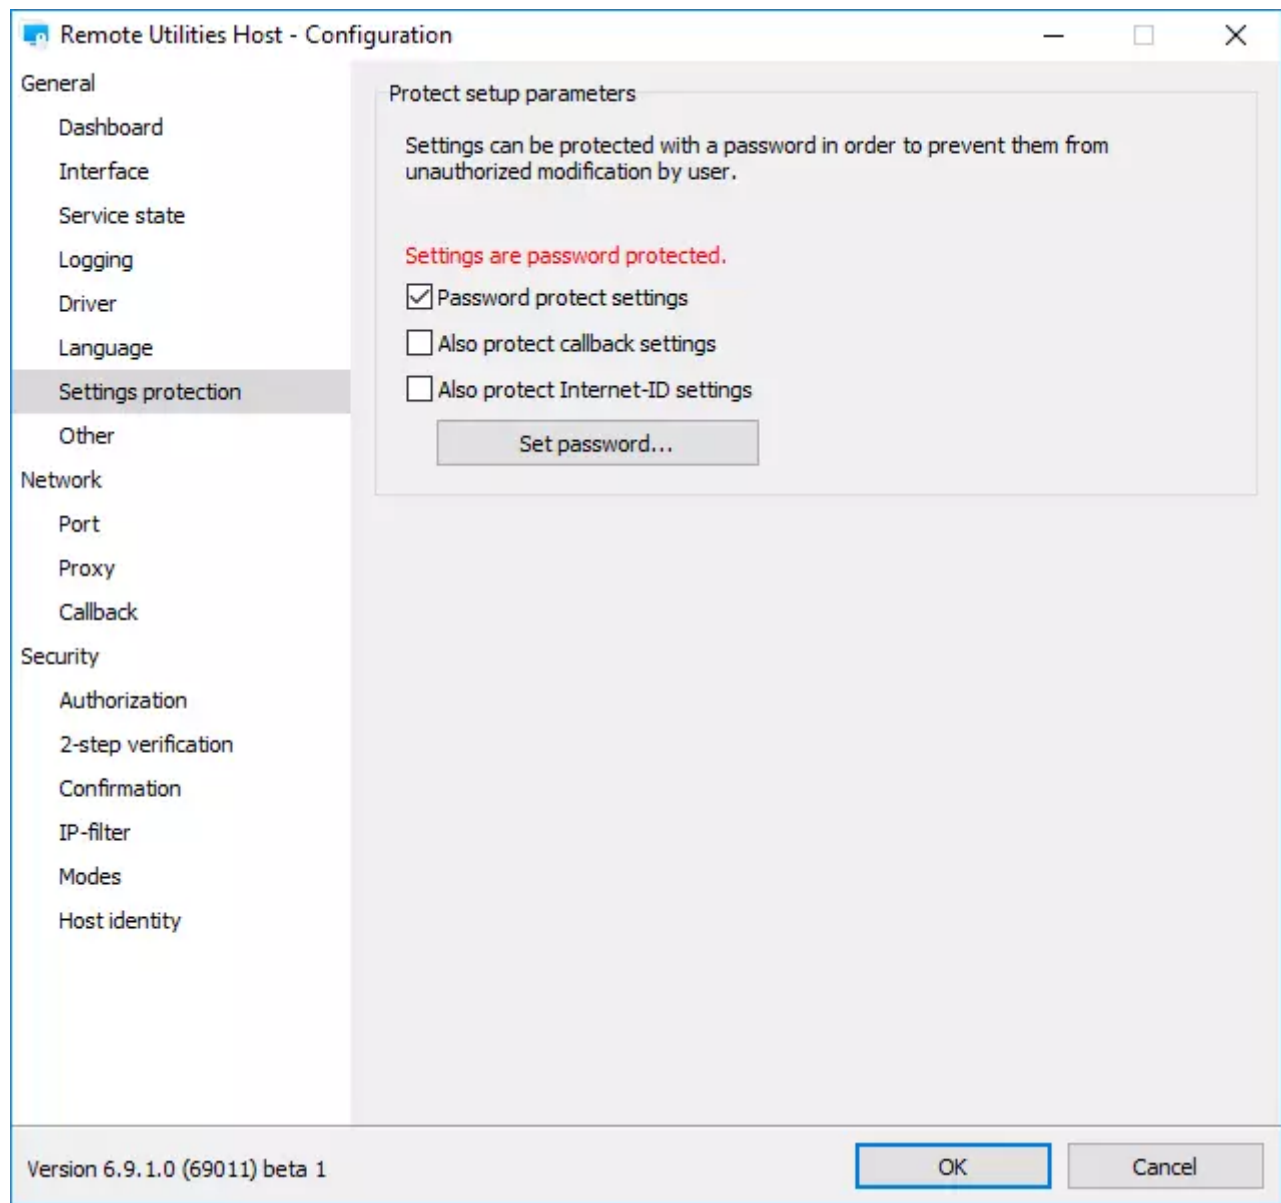

1. Right-click the **Host** icon in the system tray and select **Settings for Host**:

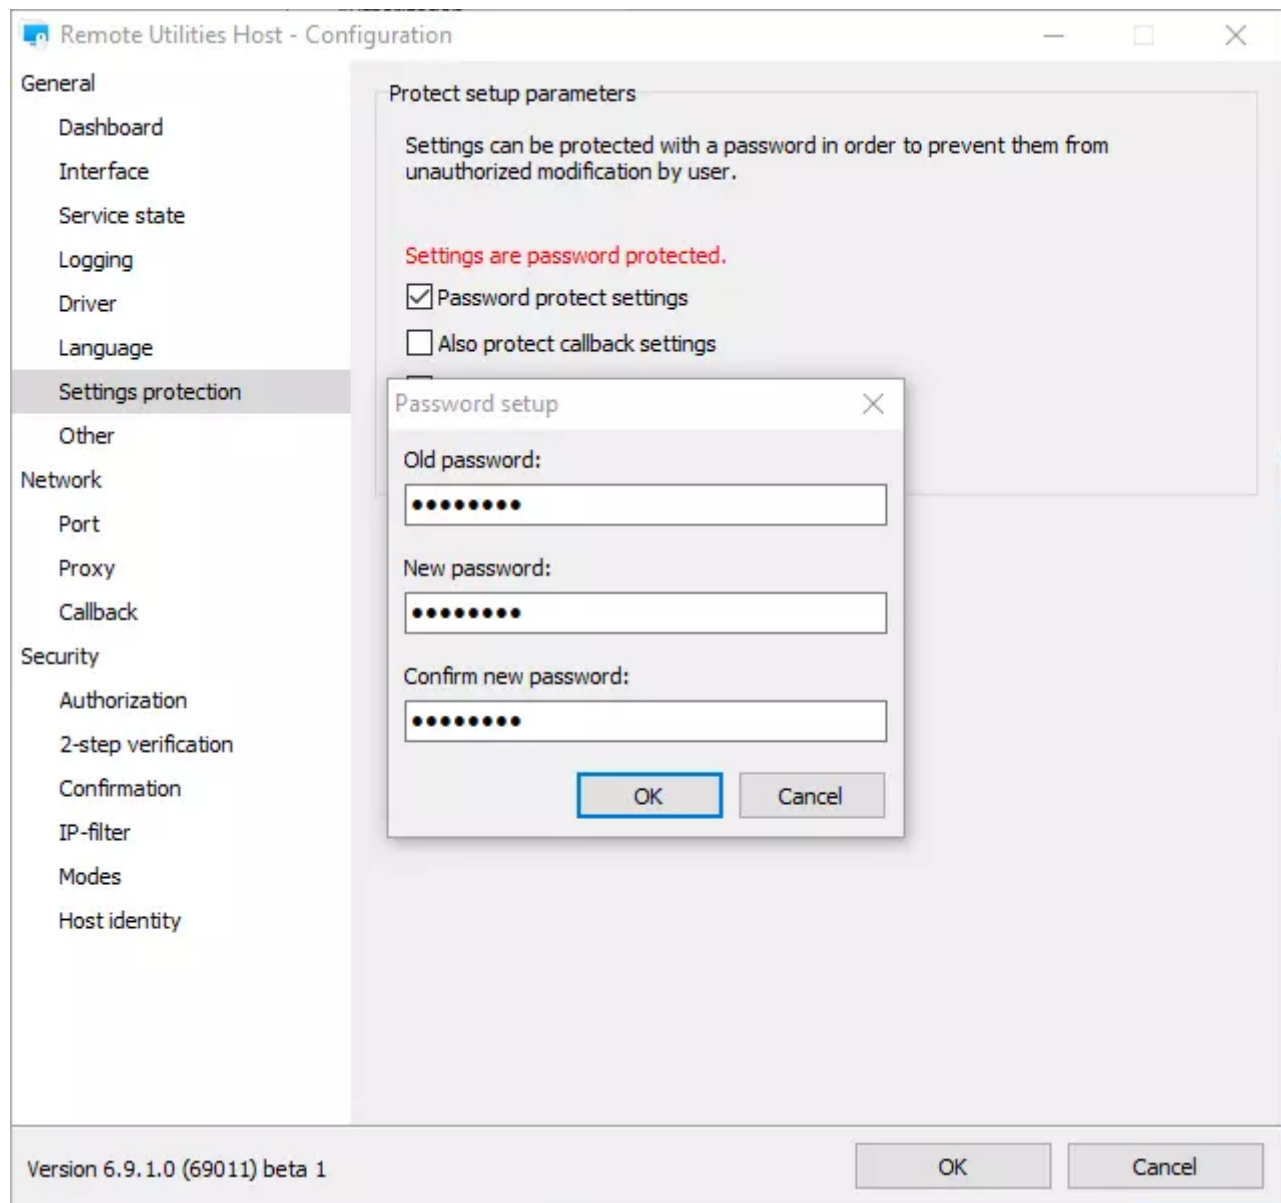

2. When prompted, enter your current settings protection password that you created earlier and click **OK**:

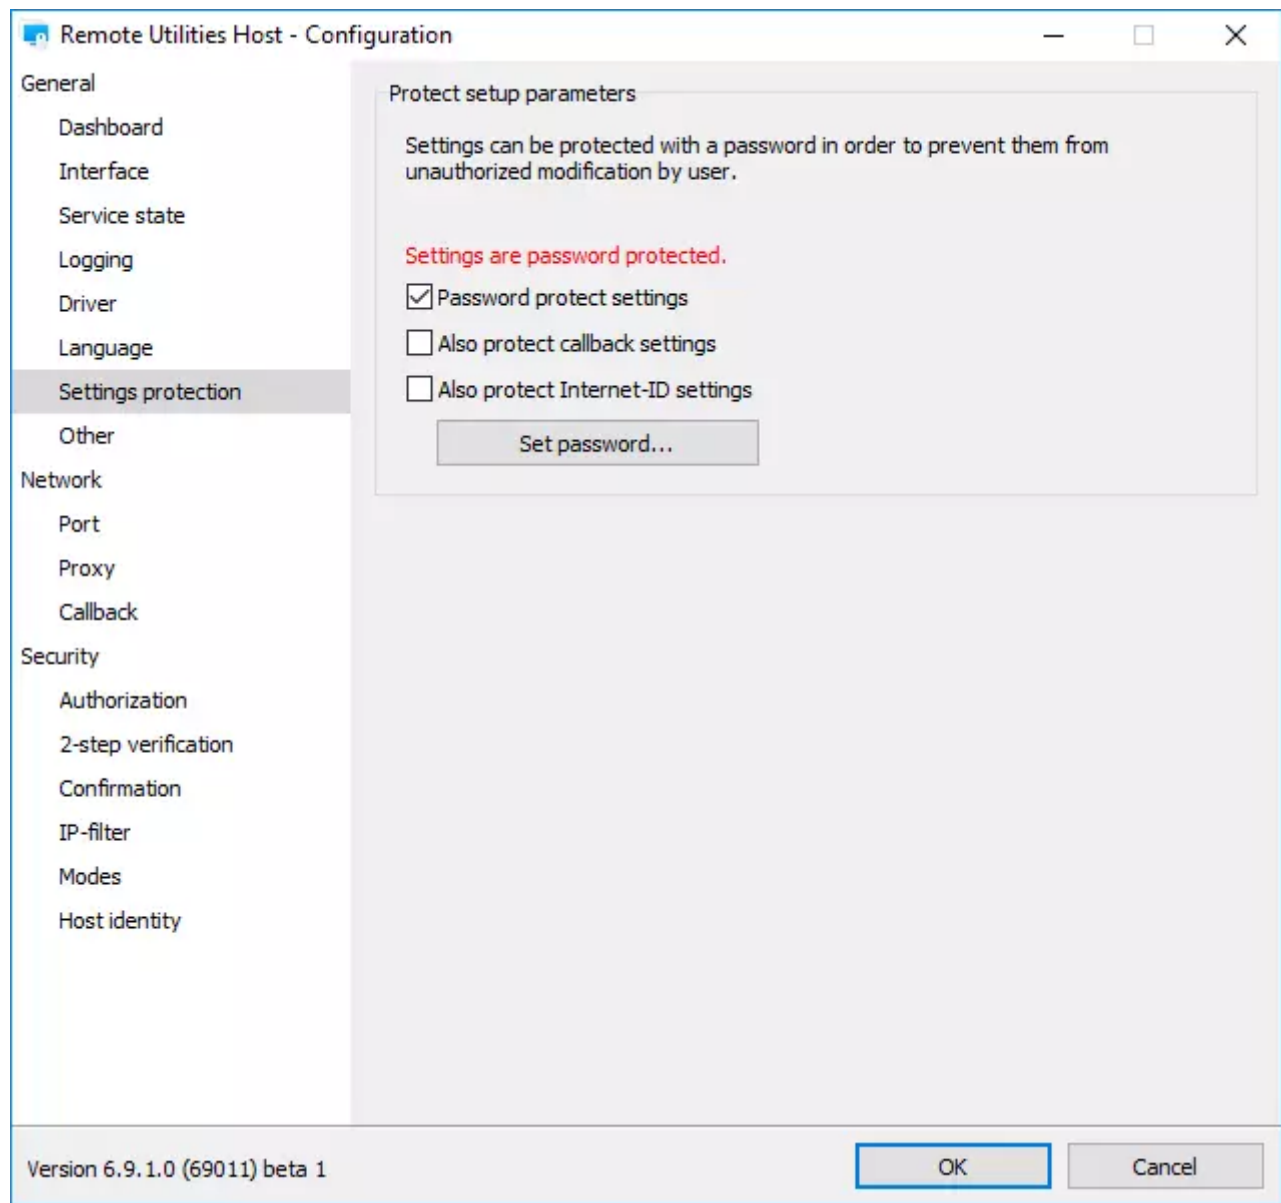

3. Navigate to the **Settings protection** tab and click **Set password...**:

4. Enter the old password, create and confirm a new password. Click **OK**:

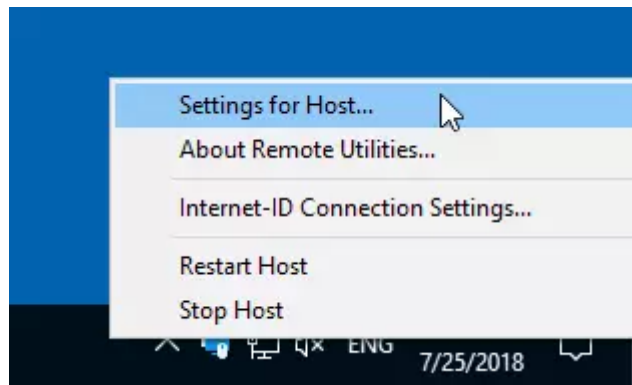

5. New password has been set. Click **OK** to close the Host settings window:

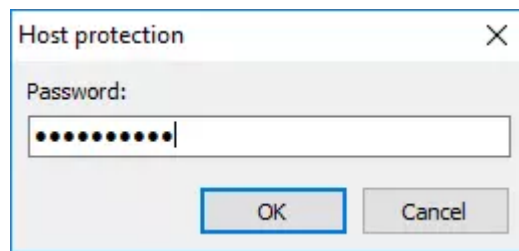

Disabling settings protection

If you no longer need to protect the settings on this Host, you can remove password protection:

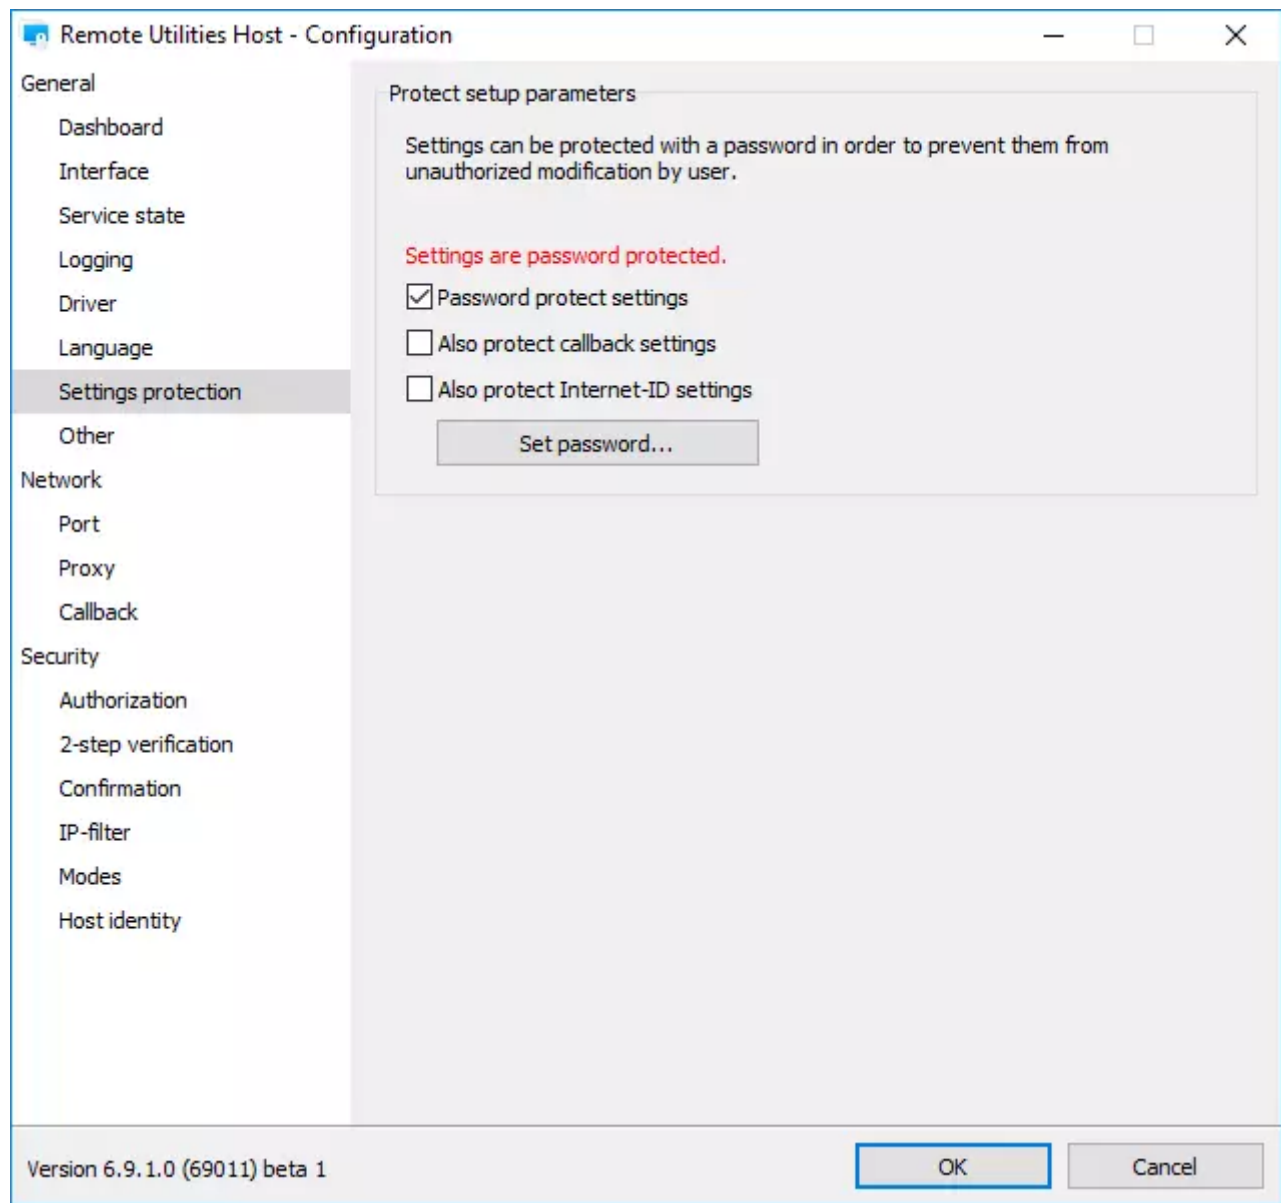

1. Right-click the **Host** icon in the system tray and select **Settings for Host**:

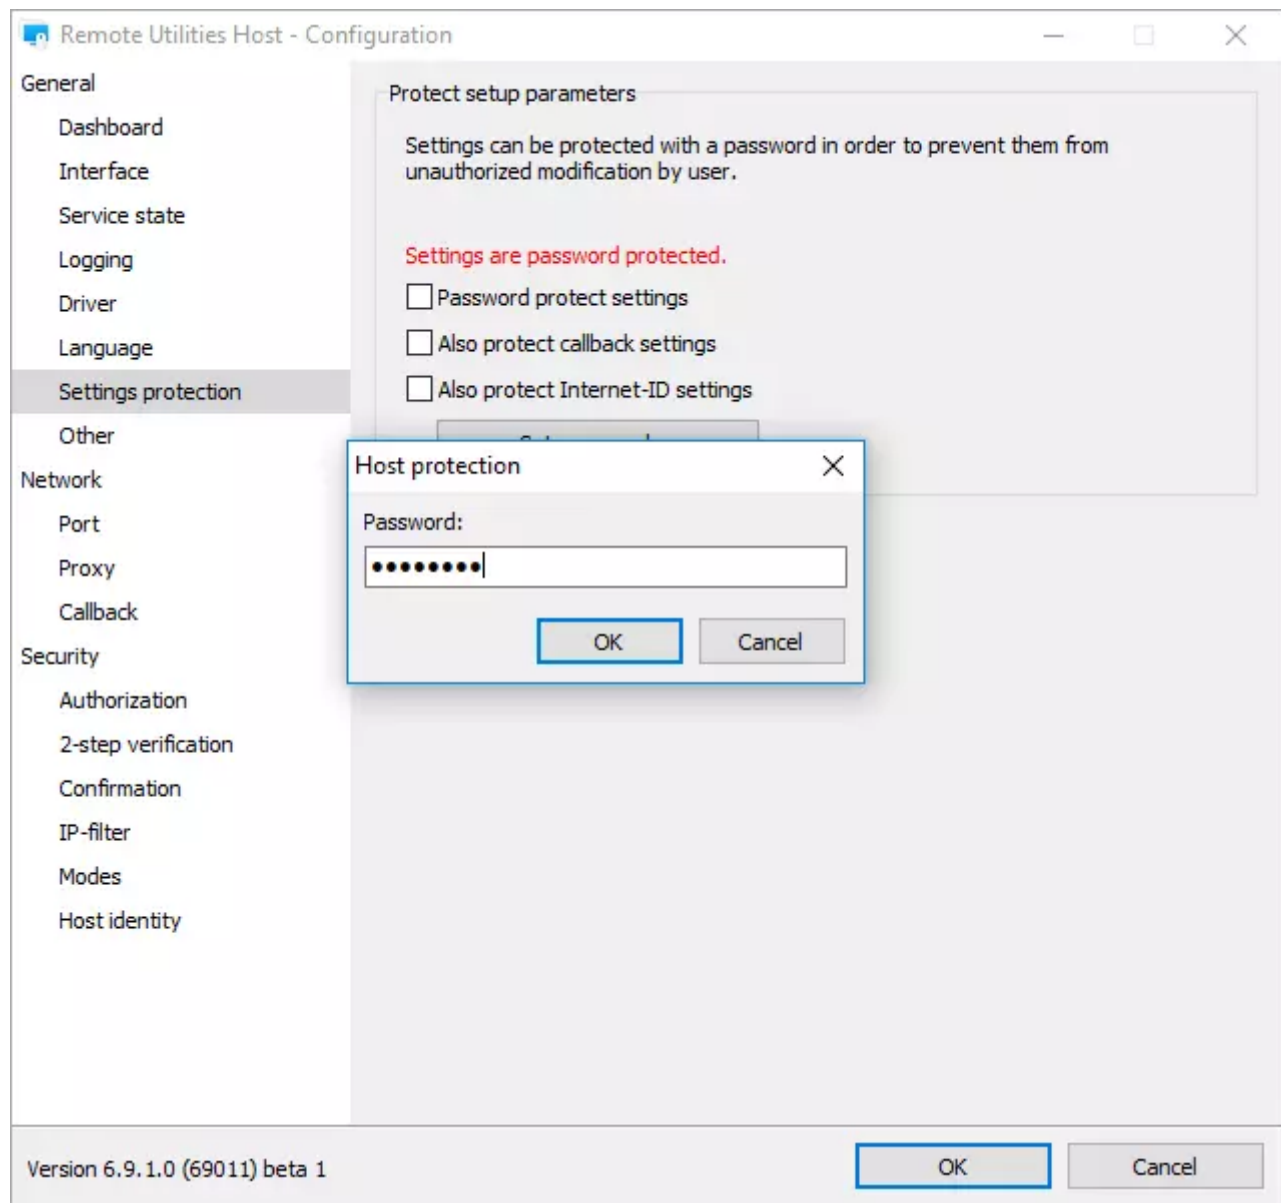

2. When prompted, enter your current settings protection password that you created earlier and click **OK**:

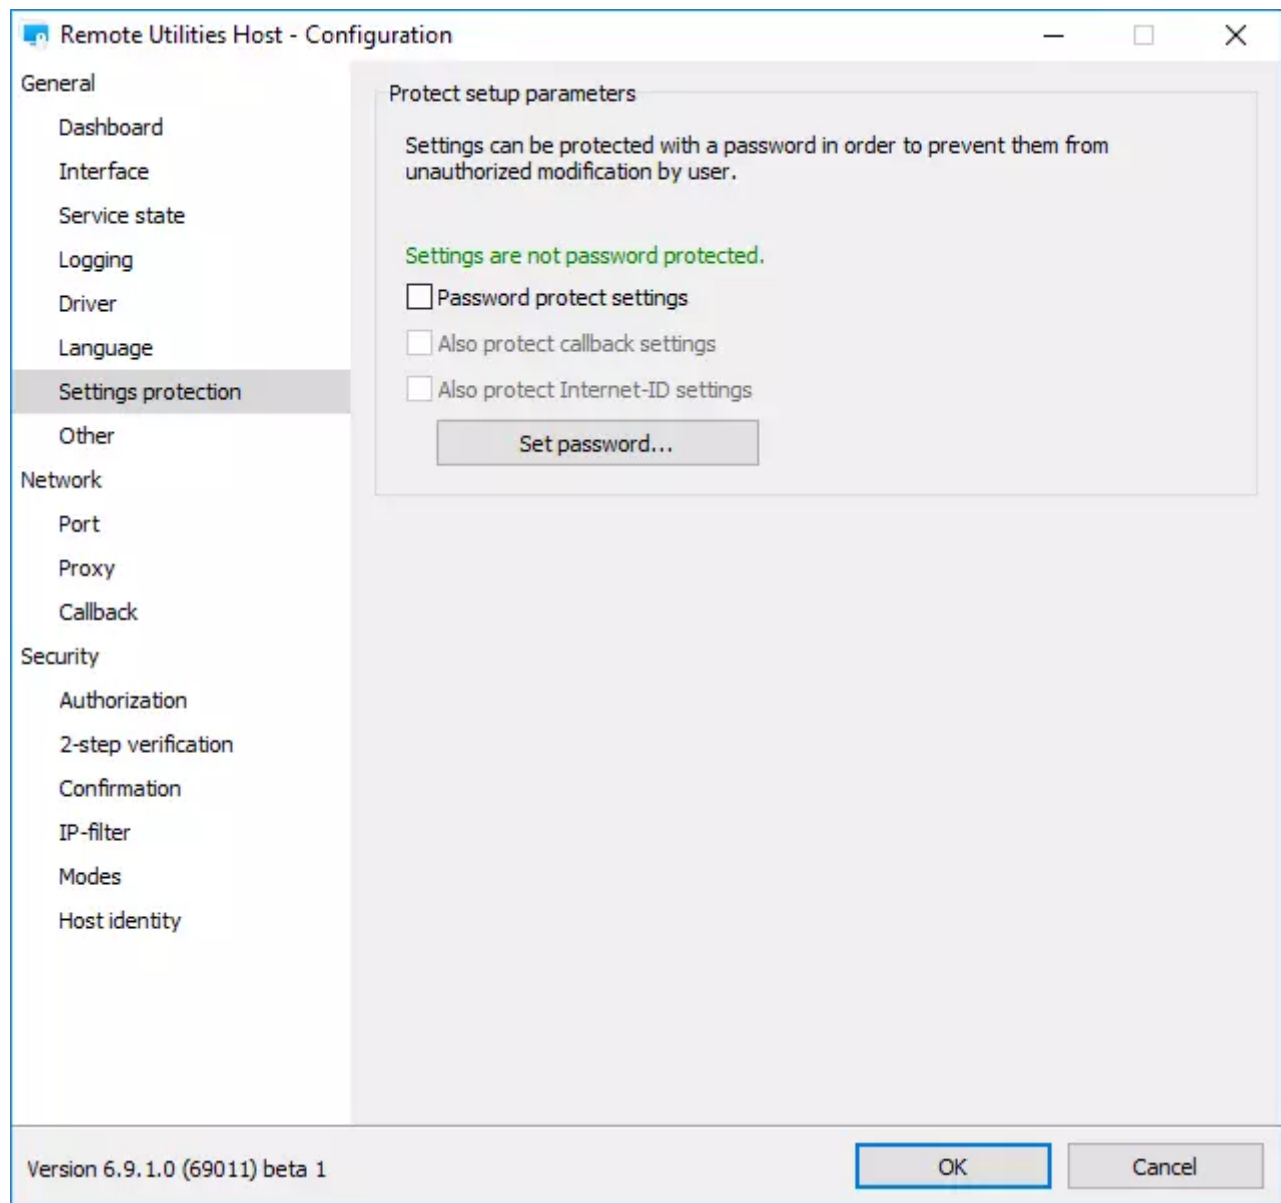

3. Navigate to the **Settings protection** tab and uncheck the **Password protect settings** checkbox:

4. Enter your current settings protection password and click **OK**:

5. Settings protection has been disabled. Click **OK** to close the Host settings window:
